Advanced measurement techniques for a wide range of applications

Figure 1 is a comparison of different measurement techniques used in Agilent's LCR meter and impedance analyzers. As you can see, each technique has special measurement advantages:

- Auto-balancing bridge offers widest impedance measurement range with typical frequency range of 20 Hz to 110 MHz. This technique is best for low-frequency, general-purpose testing.

Others	Handler interfaces	Equivalent circuit analysis built in	Equivalent circuit analysis built in, multiple functions in one instrument
Advantage	Lower-cost solution, ease of use, high speed	Frequency characteristics and resonant analysis, circuit modeling	Cost-effective, time-saving, and compact in size

- I-V technique covers from 40 Hz to 110 MHz with a more focused impedance measurement range. I-V technique also allows probing for in-circuit testing.
- RF I-V, an enhancement of the I-V technique, offers some of the high-frequency benefit of network analysis while retaining some of the impedance measurement range of the I-V technique. Designed for accuracy and high-frequency performance, the RF I-V technique is excellent for RF component analysis, especially for small inductance and capacitance values.
- Network analysis offers the highest frequency coverage, but works best when the measurement range is close to 50 Ω . With this measurement technique, impedance values are derived from reflection coefficients. Network analysis is most widely used for RF and microwave component and circuit analysis.
